

**Documentation of statistics for
Household Budget Survey 2022**

1 Introduction

The Household Budget Survey describes in detail the Danish households' expenditure on goods and services and the economic condition of the households. The statistics are used to compile weightings in the Consumer Price Index and for calculation of the private consumption in the National Accounts. The statistics were first compiled in 1897 and annually since 1994.

2 Statistical presentation

The Household budget survey is an annual statement of the detailed private consumption at household level for private households in Denmark. The survey covers private households in Denmark. The household budget survey provides a detailed breakdown of consumption. In the most detailed breakdown, consumption is divided into approx. 1,300 different consumption types.

2.1 Data description

The Household Budget Survey is an annual statement of consumption in private households. A private household is defined as an economic unit, ie a group of people who live together and have a high degree of common economy, ie share income and expenses. Persons in various types of joint households (prisons, long-term hospitalizations, certain institutions, etc.) are not covered, as it will often be impossible to separate the private economy from the institution's finances. For some of the information in the study, it is necessary to be aware of this omission, eg when analyzing hospital use (as more permanent hospital admissions are not covered). It is the private economy that alone is highlighted. Goods consumed in production (operating assets, etc.) and other business expenses are not included.

The results of the Household Budget Survey are published in nine annual tables describing consumption per. household for a given year and background information about the households such as income levels, housing conditions, geography, type of household etc. The average consumption for all Danish households as a whole (not by type) is distributed on a detailed item level (ECOICOP at 5-digit level), which includes almost 300 items and is shown in both current and fixed prices. In six tables, consumption is calculated at a less detailed level, namely at almost 50 items (calculated at a 3-digit level in ECOCIOCP). On the other hand, consumption is broken down by type of household, socio-economic status, total income, type of housing, region or age. The last table shows income and consumption by income type. Consumption here is not divided into product groups.

2.2 Classification system

Consumption covers expenditure on goods and services, used for the direct satisfaction of individual needs. Consumption is grouped by purpose in the international standard *European Classification Of Individual Consumption by Purpose*, also known as [ECOICOP](#).

The international recommendations only give instructions on the division of consumption at an overall level, but Statistics Denmark makes a further division in order to meet specific needs.

Total consumption can in the statement immediately be grouped as follows:

- Level 1 12 groups
- Level 2 46 groups
- Level 3 114 groups
- Level 4 282 groups
- Level 5 512 groups
- Level 8 approx . 1,300 individual items

see the variable list at: <https://www.dst.dk/forbrug>

For fundamental reasons, Statistics Denmark does not conduct a breakdown of the consumption of certain brands.

In addition , a large number of other groups which are documented on the website of Statistics Denmark: [Nomenklaturer](#). This is an example, region and education.

2.3 Sector coverage

Not relevant for these statistics.

2.4 Statistical concepts and definitions

Household in the Household Budget Survey: One or more persons living at the same address, who share meals and have joint income and expenses. In the Household Budget Survey, this delimitation is made by the participating households in collaboration with the interviewer.

2.5 Statistical unit

Households.

2.6 Statistical population

All private households in Denmark.

2.7 Reference area

Denmark

2.8 Time coverage

Since 1994 the survey has been published annually.

2.9 Base period

The base period for constant price calculations are at present year 2015.

2.10 Unit of measure

Consumption is measured as DKK per household per year. All amounts include VAT.

In addition, a number of characteristics are calculated, on average, for the persons in the households. These are; persons per household (including the number of children and adults), age of head of household, share of homeowners in the household and share of households with a female head of household.

Furthermore, characteristics are calculated, on average, for the dwelling itself, including size of dwelling in square meters and year of construction.

2.11 Reference period

Consumption is calculated as an annual average for the year.

2.12 Frequency of dissemination

The figures are published annually.

2.13 Legal acts and other agreements

Up to and including 2024, the Household Budget Survey is based on a “Gentlemen's Agreement”, which means that it is voluntary for the individual member states to provide Household Budget Survey data to the EU. In 2019, it was decided that the Household Budget Survey with effect from 2024 will be based on the IESS Regulation, see Regulation (EU) 2019/1700 of the European Parliament and of the Council 2019/1700 of 10 October 2019

2.14 Cost and burden

No response burden has been estimated since participation in the survey is voluntary.

2.15 Comment

Additional information can be obtained by contacting the Section for the Household Budget Survey.

3 Statistical processing

The survey is based on a sample where the number of households accounts for about 2,200 out of Denmark's total of approximately 2.6 million households.

The survey included data from three different data sources: Accounting booklets, CAPI interviews and data from registers. In this way the sample can give results which are good approximations for all private households. The data from the 3 different sources are validated. We are constantly looking at how we can improve and compile the statistic in a more efficient way.

The data is collected annually from approximately 1,100 households and the sample for one years household budget survey is based on the sample from two years. All expenses, income, etc. are converted to the price and volume level of the end year.

3.1 Source data

The Household Budget Survey is calculated at household level, and is based on a combination of interviews and accounting of the participating households. All households are simply randomly selected. In areas where data are already known through registers, data are taken from those registers. The survey used records from: - Income Register - CPR register - BBR register - Training Register and The Employment Classification Module
- Hospital Utilisation statistics

3.2 Frequency of data collection

Data are collected annually. Households participate continuously throughout the year in the survey. In this way we ensure that seasonal consumption are represented in the survey.

3.3 Data collection

An external service provider takes care of the data collection for the Household Budget Survey. Households that are randomly selected are sent a letter about participation in the survey via E-box and are subsequently contacted by telephone. If the household agrees to participate, the household must keep a 14-day account of their consumption and subsequently be visited by an interviewer who asks questions about the household's fixed expenses and major expenditure items a year back in time. The 14-day account is digital, but can also be completed on paper. The interview is conducted in CAPI (a computer-based personal in

Data 2021 has been collected via Computer Assisted Personal Interviews (CAPI), Computer Assisted Telephone Interviews (CATI) and Computer Assisted Web Interviews (CAWI), while data regarding 2022 is exclusively collected via CATI and CAWI.

Data from administrative registers is retrieved per 31 December in the reference year, or the latest year available. If data is obtained from an earlier year than the reference year, price and quantity data are converted to the price level for the reference year.

3.4 Data validation

Interview data is validated both during and immediately after the visit interview. The validation during the interview consists partly of logical and partly of probable checks, while the validation after the interview is done manually. A logical check could be, for example, whether the household has a TV, but has not reported expenses for a license or antenna association, or that the household has a car, but does not report expenses for weight tax, car insurance, etc. A likely check could be, for example, that very high or low amounts are investigated directly in the program used for the interview and that the household is confronted with this and must deal with whether it is correct.

When data is received in Statistics Denmark, it goes through a validation which, for example, involves assessing the household's consumption in relation to its size. If, for example, there is only one person and a very high water consumption, or there are, for example, two adults with children, where it has not been reported how many months have been used for daycare and school, the household will be contacted to clarify the accuracy of the information. Some corrections are made without contacting the household, where the description of the purchase and the amount seem contradictory. It could be, for example, that a liter of milk is registered with an amount of DKK 1,000. This will be corrected to DKK 10.00.

The 14-day accounts are validated continuously when they are received, and collectively when the collection of accounts for a year has been completed. In the overall validation, it will be checked, for example, whether all purchases are coded correctly according to the classification, ECOICOP.

3.5 Data compilation

When we have finished the validation of the interviews and accounts booklets the registry variable are linked in the data set. Sometimes it's difficult to find the household in the sample in the register data, this kind of difficulties can often be attributed to differences in the calculation date. When this happens we make manual imputation of for example, an individual's level of education.

After finishing the processing of Micro-data the enumeration process of making the data representative for the entire country begins. The figures in all tables are weighted this is done in order to partially resolve the gaps, as different dropout and pure random coincidences leads. Those types of Household where the risk for not participating in the survey is relatively large, which therefore results in too few households in the survey are assigned a relatively large weight, while household types, as there are too many of, is assigned a relatively small weight.

Information about both the enumerated number of households in Denmark after the weighting and on the actual number of households in the survey can be found in most tables. This last statement is relevant to assessing the sampling uncertainty, since a small number of households results in a relatively large uncertainties.

The weights are calculated using a regression estimate. The focus is on each characteristics of the relationship between sample and population. The advantage of this method is that many more features are considered than in the former method were post-stratification was used. Following characteristics are involved in the estimation:

- Household size and composition
- Income
- Main Income Recipient's socio-economic status
- The household owns or rents the dwelling
- What type of urban household lives in
- Education
- Gender
- Geography

3.6 Adjustment

We do not make other corrections of data besides those corrections described during data validation and data processing.

4 Relevance

In addition to the general public the Household Budget Survey has a wide application. Internally in Statistics Denmark during the compilation of national accounts and price indexation. Public authorities' planning and feasibility studies, etc. Internationally, where especially EUROSTAT is very active in order to establish comparable figures between countries. Research in a number of areas, as well as for marketing purposes.

4.1 User Needs

In addition to serving the general public interests the survey has a broad group of users:

- It is used internally at Statistics Denmark in compiling price indices and national accounts statistics.
- Government bodies use the survey for purposes of planning and for conducting analyses of the consequences of new legislation, etc.
- The survey is used for researches purposes within several fields.
- The survey can be used for marketing purposes, etc.
- Internationally, the survey is widely used. Especially, Eurostat is very active in enabling comparability of the survey results among the EU Member States.

The statistics are very rich in detail and have a relatively long production time.

4.2 User Satisfaction

A user satisfaction survey has not been conducted.

4.3 Data completeness rate

The Household Budget Survey is indirectly subject to the Council Regulation (EC) No. 2494/95 (1) of 23 October 1995 concerning harmonised indices of consumer prices. The Household Budget Survey provides data to Eurostat every 5 years and meets in this respect the guidelines sent out by Eurostat.

5 Accuracy and reliability

With only 13 pct. of the households who have been contacted participating in the Household Budget Survey. This creates uncertainty, not least for detailed consumer groups. For total consumption, this means that there is an uncertainty margin of +/- 1.2 per cent. while that for that for bread is 2 per cent. and 28 per cent. for a rarely purchased item such as condensed milk. There is underreporting in a number of areas such as alcohol, tobacco, prostitution and undeclared work. The uncertainty is greater when data is based on accounting rather than interviews, and it will be greater if one looks at smaller subgroups of households.

5.1 Overall accuracy

Only 2,301 households out of 17,730 selected households chose to participate in the Household Budget Survey 2022. For the total consumption for the entire population, there is an uncertainty margin of +/- 1.2 per cent, so that the total consumption, which is estimated at DKK 359.661. with 95 percent certainty, it is expected to lie between DKK 348,434 and DKK 370,888. For individual groupings in the population and product groups that are rarely traded, the uncertainty is greater. The consumption is thus more precisely calculated for, for example, households with higher incomes or where the main income recipient is of Danish origin, is in work, is over 60 or has education beyond primary school, as there are relatively more of these groupings who participated in the survey.

5.2 Sampling error

The total sample for the Household Budget Survey 2022 consisted of a total of 17,516 households drawn in respectively 2021 (9,551) and 2022 (8,179). In 2022, 1,123 households participated, while 1,178 households participated in 2021 a total of 2,301 for FU2022. The participation rate for the Household Budget Survey 2022 was thus 13 per cent. Sample uncertainty is calculated for the individual consumer product groups based on the households that have chosen to participate in the survey. In the Household Budget Survey 2022, the sample uncertainty is based on the responses from 2,301 participating households. The sampling uncertainty is quantified by the coefficient of variance (the relative standard error).

The coefficient of variance for the total consumption per household in the Household Budget Survey was 1.2 per cent. This means that at 95 per cent the confidence interval for the total consumption per household is DKK 359.661 +/-5,728.

There is great variation in the sampling uncertainty between total consumption and specific consumptions categories. Consumables that are bought often have a lower sample uncertainty than consumables that are seldom bought.

Bread, for example, is a product group that most households often buy during the week-long accounting they have had in connection with participation in the survey. The coefficient of variance on bread for an inspection household is 2 per cent, while that for eg preserved milk is 28 percent.

Similarly, the coefficient of variance is 3,9 percent in the region of the capital, while it is 7,4 percent in the region of Zealand. Tables on <http://www.dst.dk/consumption.dk> shows the detailed coefficients of variation.

5.3 Non-sampling error

The sample basis for the study is inhabited private household addresses in Denmark for a given year. The pull-out frame contains not only private households, but also common households. Attempts are made to avoid this in the Household Budget Survey, by only extracting households with a maximum of 8 inhabitants. This may give rise to a bias in that we do not extract large private households (households with more than 8 people), but this problem is estimated to be minimal.

The framework population is based on two calendar year populations and must affect the target population in one given year. The target population is thus represented by a framework population from 2021 merged with one from 2022. In general, the framework population, which is based on 2021, largely covers 2022. However, some households may change character from 2021 to 2022.

5.4 Quality management

Statistics Denmark follows the recommendations on organisation and management of quality given in the Code of Practice for European Statistics (CoP) and the implementation guidelines given in the Quality Assurance Framework of the European Statistical System (QAF). A Working Group on Quality and a central quality assurance function have been established to continuously carry through control of products and processes.

5.5 Quality assurance

Statistics Denmark follows the principles in the Code of Practice for European Statistics (CoP) and uses the Quality Assurance Framework of the European Statistical System (QAF) for the implementation of the principles. This involves continuous decentralized and central control of products and processes based on documentation following international standards. The central quality assurance function reports to the Working Group on Quality. Reports include suggestions for improvement that are assessed, decided and subsequently implemented.

5.6 Quality assessment

The Household Budget Survey is a sample survey, combined with a wide range of register variables. The survey is based on a simple randomly drawn sample. The survey has over a number of years been conducted by the same procedure.

The study's annual sample is not large enough to only give a reliable estimate of consumption. Therefore included sample data from the previous years also in the total charge for the year. The study has the character of a sort of "moving average".

Through several years the study has been conducted by the same procedure. This has been conducted partly to ensure a better comparison over time and partly to provide faster results and to minimise errors.

The Household Budget Survey was in the period 1994-2013 based on a three-year sample. From 2014 and onwards, the Household Budget Survey is based on a two-year sample. This is an improvement of the Household Budget Survey, since the figures brought forward by 12 months.

5.7 Data revision - policy

Statistics Denmark revises published figures in accordance with the [Revision Policy for Statistics Denmark](#). The common procedures and principles of the Revision Policy are for some statistics supplemented by a specific revision practice.

5.8 Data revision practice

Since the publication of the Household Budget Survey 2017, there is only an annual publication, therefore no revisions will be made in the future.

6 Timeliness and punctuality

The statistics are published approximately 12 months after the end of the reference year. The statistics are usually published according to the time announced.

6.1 Timeliness and time lag - final results

The statistics are published approximately 12 months after the end of the reference year.

6.2 Punctuality

The statistics are usually published without delay in relation to the scheduled date.

The Household Budget Survey 2020 was four weeks delayed due to delayed income data due to COVID19.

7 Comparability

The Household Budget Survey is conducted in accordance with guidelines from the European statistical agency Eurostat. Comparable figures are published by Eurostat. Since 1994, the survey has been methodologically rearranged and is now conducted annually by the same method and on a comparable basis.

Data for 2014 and onwards are based on a two-year-old sample and COICOP5 nomenclature (Classification of Individual Consumption). To ensure comparability and continuity over time, data from 1994 to 2013 were recalculated in compliance with the new nomenclature in both current and constant prices

7.1 Comparability - geographical

The calculation of the Household Budget Survey is based on international recommendations and therefore there is a good correlation with figures from countries of the European Union. Eurostat publishes every five years each country's Household Budget Survey in their publication databases.

7.2 Comparability over time

The first time Danes' consumption was recorded was in 1897, when the consumption of Danish working families was investigated. Up until 1994, various studies were carried out on Danes' consumption - and for different groups of the population. Thus, in 1909, household accounts were made for each urban workers, farm workers, householders and farm workers and in 1916 for civil servants' families. From 1971 consumption surveys have been carried out. In 1971, it was the consumption of wage earners that was investigated and from 1976 it is the consumption of private households that is investigated.

Since 1994, annual surveys of Danish households' private consumption have been carried out. The collection method has been to collect data for three consecutive years, which were combined to form a sample. Data from year $t - 1$ and $t + 1$ have been price and quantity adjusted to year t (mid-year) level. The disadvantage of the model has been that it only replaced data for year $t + 1$ and price and quantity converted to the middle year, t . The study has therefore had the character of a kind of moving average. Basing the sample on a 2-year sample from 2014 did not solve the problem. However, it accelerated the production of data and thus made the study more timely and relevant. The method continues to be annual data collections. The sample now consists of years $t - 1$ and t . The sample for 2022 thus consists of data from the year 2021 ($t - 1$) and the year 2022 (t). These prices and quantities are converted to the price level in 2022.

Since the publication of figures for 2014, the Household Budget Survey has been based on a 2-year sample and follows the ECOICOP nomenclature. The consequence of these changes is that revised data from the publication of figures for a given year, t is now published 12 months after the reference year, compared to 22 months previously. To ensure comparability and continuity, data from 1994 until 2012 has been recalculated according to the ECOICOP nomenclature in both current and fixed prices.

Since 2012, the survey has been supplemented with data in constant 2005 prices. This makes it possible to determine the volume development over time.

7.3 Coherence - cross domain

The classifications and definitions used are aimed to be as comparable as possible with the national accounts. But the methods, etc., in these two kinds of statistics are very different. The classification of consumption is based on the international COICOP5 classification, which is also used in compiling price indices. It is difficult to conduct comparisons with the general population statistics and other register-based statistics, as the household definition in the survey is different: In the survey the household definition is the economic unit, which is decided by the household members themselves, while in the general population statistics the household definitions are derived from the administrative registers-based information.

7.4 Coherence - internal

The Household Budget Survey is based on three data sources, interviews, accounting and registers. A great deal of work is done to ensure that the register information used is consistent and valid in relation to linking it to the interview and the accounting information.

8 Accessibility and clarity

The Danish Household Budget Survey is published in a Danish press release, at the same time as the tables are updated in the StatBank. In the StatBank, these statistics can be found under [Household Budget Survey](#). For further information, go to the [subject page](#).

8.1 Release calendar

The publication date appears in the release calendar. The date is confirmed in the weeks before.

8.3 User access

Statistics are always published at 8:00 a.m. at the day announced in the release calendar. No one outside of Statistics Denmark can access the statistics before they are published.

8.2 Release calendar access

The Release Calendar can be accessed on our English website: [Release Calendar](#).

8.4 News release

These statistics are published in a Danish press release.

8.5 Publications

The Household Budget Survey does not feature in any [Publications](#) from Statistics Denmark.

8.6 On-line database

The statistics are published in the StatBank under the subjects in the following tables:

- [FU01](#): Household budget survey by background information, group of households and time
- [FU02](#): Household average consumption by group of consumption, price unit and time
- [FU03](#): Consumption by group of consumption, households, price unit and time
- [FU04](#): Consumption by group of consumption, socioeconomic status, price unit and time
- [FU05](#): Consumption by group of consumption, total income, price unit and time
- [FU06](#): Consumption by group of consumption, type of dwelling, price unit and time
- [FU07](#): Consumption by group of consumption, region, price unit and time
- [FU08](#): Consumption by group of consumption, age, price unit and time
- [FU09](#): Average household income and consumption by type of income and time

8.7 Micro-data access

Researchers and other analysts from authorized research institutions, can be granted access to the underlying Micro-data by contacting [Research Services](#).

8.8 Other

Eurostat publishes internationally comparable statistics, including Danish, for the Household Budget Survey in their [database](#).

8.9 Confidentiality - policy

[Data Confidentiality Policy](#) at Statistics Denmark are followed.

8.10 Confidentiality - data treatment

The survey is performed under full anonymity. The publication is published so that it is not possible to identify individuals.

8.11 Documentation on methodology

Documentation on methodology only exists in Danish.

8.12 Quality documentation

Results from the quality evaluation of products and selected processes are available in detail for each statistics and in summary reports for the Working Group on Quality.

9 Contact

The administrative placement of these statistics are in the division of Prices and Consumption. The person responsible is America Solange Lohmann Rasmussen tel. +45 39 17 31 56, e-mail: slr@dst.dk
